EDUCATION

Jilin University, Changchun, China (Project 985 University)

M.S. in Automotive Engineering (**Exam-Free Admission**), College of Automotive Engineering

Research Direction: vehicle motion control, corner-module vehicle, nonlinear dynamics and model-/learning-based control

Awards include **WEICHAH POWER Social Scholarship (Top 1%)**, **Outstanding Student Scholarship** and **Academic Scholarship**.

Sept 2024–Jun 2027 (Expected)

Supervisor: Prof. Junnian Wang

Jilin University, Changchun, China

B.Eng. in Automotive Engineering, College of Automotive Engineering

Awards include **Second Class Scholarship** and **Outstanding Student of the College**.

Sept 2020–Jun 2024

GPA: 87.89/100 | A-

PUBLICATIONS & PATENTS

Papers

[First Author] Generalized Fault-Tolerant Control for Multi-Wheel Corner-Module Vehicles via Reconfigurable MPC.

IEEE/ASME Transactions on Mechatronics (JCR **Q1**; IF=6.3), under review.

This work proposes a generalized fault-tolerant control framework for multi-wheel corner-module vehicles, integrating automatic topology identification, reconfigurable MPC, and physical latent-space optimization, with HIL validation of real-time performance and robustness.

[First Author] Nonlinear Shimmy Dynamics Analysis of Highly Integrated In-Wheel Motor Driving Unit with Independent Kingpin Steering for Electric Vehicles. *Nonlinear Dynamics* (JCR **Q1**; IF=5.7), under review.

This work proposes a nonlinear shimmy dynamics analysis framework for highly integrated in-wheel motor driving units (HIDUs), combines complex variable averaging (CX-A) and eigenspace-projected shooting methods for bifurcation analysis, develops an FPSA method for efficient parameter evaluation, and reveals parameter-dependent shimmy suppression mechanisms through energy-flow analysis.

[Contributor] A Review of Configuration Classification, Application Control and Future Trends of Highly Integrated Driving Corner Modules for Electric Vehicles. *Automotive Innovation* (JCR **Q1**; IF=7.6), under review.

[Contributor] HalluAgent: Type-Conditioned Mitigation Visual Evidence for Hallucination Mitigation in Large Vision-Language Models. *AAAI Conference on Artificial Intelligence (CCF-A)*, under review.

Patents

As the **first student inventor**, I have authored **10 granted or published invention patents**, including **one granted U.S. patent**, and participated in **18 granted or published invention patents** in total.

- Kingpin Steering and Omni-Directional Steering Dual-Mode Power-Multiplexing Electric Wheel Angle Module. (**US20260200519A1**, granted Jul 2026; CN120246072A, granted Aug 2025.)
- Distributed Supercapacitor Energy Storage System Based on Electric Wheel Corner Modules. (CN120287823A, granted Oct 2025.)
- Land-Air Power-Multiplexing Flying Car Using Electric Wheel Corner Modules. (CN121492543A, published Feb 2026.)
- A Control Method for a Power-Multiplexed Integrated Drive-Braking Electric Wheel System. (CN120287825A, published Jul 2025.)
- Multi-Link-Braking Integrated Drive-Braking Electric Wheel System. (CN120481601A, published Aug 2025.)
- Power-Multiplexed Integrated Drive-Braking Electric Wheel System. (CN120287824A, published Jul 2025.)
- Highly Integrated Driving Unit with Electronically Adjustable Kingpin Caster Angle. (CN121492543A, published Jul 2025.)
- Electronic Wedge Braking System with a Sprung Actuator. (CN120288017A, published Jul 2025.)
- Multi-Mode Redundant Integrated Drive-Braking Electric Wheel System. (CN120287823A, published Jul 2025.)

RESEARCH PROJECTS

Key Technologies for Highly Integrated In-Wheel-Motor Driving Units Changchun, China *National Key R&D Program of China, Grant No. 2024YFB2505100* Apr. 2025 – Present

- Served as a main contributor to the sub-project **Motion Characteristics Analysis and Configuration Design of Highly Integrated In-Wheel-Motor Driving Units**, developing high-fidelity MATLAB/Simulink mathematical models and Adams Car multibody dynamics models for shimmy mechanism analysis and parameter sensitivity studies. Proposed a nonlinear shimmy dynamics analysis workflow for evaluating HIDU shimmy performance, which has been implemented as a preliminary analysis software tool.
- Designed a coordinated driving–braking–steering shimmy stability control strategy for highly integrated driving units, considering strong nonlinearities including suspension–steering coupling, steering backlash, and dry friction.

Certifiable Latent Interface for Multimodal Robot Control

Ongoing Research

- Control-Relevant Latent State Representation:** Explore history-dependent latent state representations that selectively retain task- and control-relevant information from multimodal observation histories while attenuating nuisance variations, perception noise, and irrelevant historical information.
- Certified Action Policy Generation:** Develop latent-to-policy parameterizations with built-in closed-loop guarantees, such that all high-level action policies generated from admissible latent states remain feasible and safe when integrated with a stabilizing low-level controller and the physical plant.
- Certificate-Preserving Latent Planning and Policy Optimization:** Explore online planning in the learned latent space and reinforcement-learning-based optimization of the action-policy generator to improve task performance, while ensuring that both latent and policy updates remain within certified admissible sets and preserve closed-loop guarantees.

Dynamics-Aware VLM Planning Framework for Autonomous Vehicles

Ongoing Research

- Current VLM-based planning methods often overlook variations in vehicle dynamic capabilities across chassis configurations, road conditions, and driving scenarios, which may produce dynamically infeasible or unreliable trajectories. This work proposes a dynamics-aware VLM planning framework that integrates online-updated vehicle motion envelopes with closed-loop trajectory feasibility feedback, aiming to bridge high-level semantic planning and dynamically executable vehicle motion while improving reliability and safety.

Hybrid Energy Storage and Regenerative Control for Distributed Electric Chassis

Mar. 2024 – Oct. 2024

- Designed a battery–supercapacitor hybrid energy-storage and regenerative-braking framework for distributed electric chassis, including system topology selection and parameter matching, ADVISOR/Simulink modeling, power-split control, and regenerative braking optimization. Further extended the architecture to distributed supercapacitors integrated into electric corner modules for local regenerative-energy storage, power supply for wheel–end actuators, and battery–supercapacitor fault redundancy.

INTERNSHIP

XPENG Motors, XNGP Team

Guangzhou, China

Autonomous Driving R&D Intern

Jan 2024–May 2024

- Studied the XNet-XBrain-XPlanner modular end-to-end autonomous driving framework adopted in XPENG’s XNGP system.
- Participated in the large-scale data closed loop for urban road tests, takeover events, corner cases, and OTA iterations, focusing on failure-scenario identification, abnormal takeover analysis, and root-cause investigation.

Gspeed Formula Racing Team of Jilin University

Changchun, China

Member of Suspension Group

Dec 2020–Dec 2023

- Designed and modeled critical suspension components using CATIA, produced engineering drawings in AutoCAD, and built force-analysis tables for corner-wheel components based on hardpoints and vehicle performance targets.
- Participated in the full cycle of suspension system assembly, maintenance, and tuning.

SKILLS

Application & Coding: MATLAB/Simulink, Python, C/C++, CATIA, AutoCAD. **English:** IELTS 6, CET-6. **Cantonese/Mandarin:** Native.
